TITLE: Quasistatic bending and stability of shells under creep (inheritance theory)

SOURCE: Kazan. Universitet. Issledovaniya po teorii plastin i obolochek, no. 2,  
1964, 145-158

TOPIC TAGS: creep, shell structure stability, metal bending

ABSTRACT: The paper discusses some approximate solution methods for problems concerning the bending of plates and shells when the bending is comparable to the thickness. The solutions are based on a variational method and the method of a small parameter. During the development of creep deformation, the shell acquires a bent shape for which a certain stress is critical. With the assumption that the relative elongations are small in comparison to unity, the calculation is based on the linearized relationship between the stresses and deformation developed by Yu. N. Rabotnov in his theory of "hereditary creep". This relationship is given by

$$\epsilon_{mn}(t) = B_{mnk} \sigma^{lk}(t) + \int_0^t K(t-\tau) B_{mnk} \sigma^{lk}(\tau) d\tau. \quad (1.1)$$

Card 1/2

L 10433-67

ACC NR: AT6032967

where  $\epsilon_{ik}$  are the contravariant components of the stress tensor;  $B_{mnk}$  - components of the elastic constants tensor;  $K(t - \tau)$  is the kernel of the aftereffect;  $t$  - time;  $\epsilon_{mn}$  - covariant components of the deformation tensor. Application of an approximate method is justified because of the considerable scatter of experimental data. Orig. art. has: 2 tables and 48 equations.

TITLE: Approximate solution methods for problems of irregular creep in thin films

SOURCE: Ref. zh. Matematika, Abs. 5B283

REF SOURCE: Sb. Issled. po teorii plastin i obolochek. No. 3, Kazan', Kazansk.  
un-t, 1965, 270-279

TOPIC TAGS: thin films, creep, approximate solution, approximation method

ABSTRACT: General equations for thin film creep with small deformations are examined on the basis of hardening theory. Initial relationships are formulated by introducing quadratic forms of stress and moments and, consequently, for elongation and bending; each relationship contains an arbitrary constant, chosen on energy considerations. Introduction of generalized and supplementary scattering functions permits approximate formulation of the basic dependence between force and kinematic characteristics under creep conditions. The corresponding variational principles are formulated. The approximate variational method for solving irregular creep problems is described. An example is given of bending of a sloping spherical segment, with one rigidly fastened end, under a hydrostatic pressure. [Translation of abstract] V. Shamin

TITLE: Approximate methods of solving problems of unsteady creep of thin shells

SOURCE: Ref. zh. Mekhanika, Abs. 5B358

REF SOURCE: Sb. Issled. po teorii plastin i obolochek. No. 3. Kazan', Kazansk. un-t, 1965, 270-279

TOPIC TAGS: metal creep, approximation method, thin shell structure

ABSTRACT: The general equations of creep of thin shells under small strains are examined on the basis of the theory of hardening (with a power dependence). Quadratic forms of forces and moments and of rates of elongation and curvature, respectively, containing one arbitrary constant for each are introduced for constructing the initial relations (by analogy with the proposal of V. I. Rozenblyum (see Prikl. matem. i mekhan., 1963, 27, No. 1, 154-159--RZhMekh, 1964, 8B419)). These constants are suitably selected on the basis of energy considerations (unlike the aforementioned work of V. I. Rozenblyum where the Drucker-Kaladin theorems of inclusion are used). The introduction of generalized functions of dissipation and additional dissipation permit obtaining approximate formulations of the basic relations between power and kinematic characteristics under creep conditions. The formulations of corresponding variational principles are given. An approximate variational method of solving problems of unsteady creep of shells is presented. Bending of a sloping spherical segment with a

TITLE: Variation method in the theory of nonstationary creep

SOURCE: Ref. zh. Mekhanika, Abs. 6V306

REF SOURCE: Sb. Issled. po teorii plastin i obolochek. No. 3. Kazan', Kazansk. un-t, 1955, 280-293

TOPIC TAGS: shell theory, shell stability, thin shell, thin plate

TRANSLATION: At the beginning of the article, a variational principle is formulated for nonstationary creep of a body in a geometrically nonlinear form. Elongations and shifts are assumed to be small; equations of the theory of flow under a power-series law are used. In the second part of the article, this variational principle is applied to the theory of thin plates and shells with a few supplementary simplifications. The problem of the stability of an infinitely long sloping cylindrical panel under the action of lateral loading is studied. The solution is constructed according to the method of Dubnov-Galyorkin for one undetermined time function. L. M. Kachanov.

AUTHORS: Mushtari, Kh. M., Teregulov, I. G. SOV/20-128-6-13/63

TITLE: On the Theory of Shells of Moderate Thickness

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 6, pp 1144-1147  
(USSR)

ABSTRACT: The authors based their investigations on the principle of virtual displacements to derive the equations for the equilibrium of shells. These equations make it then possible to introduce simplifications of a predetermined accuracy. Moreover, the problem of boundary conditions in the theory of thick plates and shells is solved here. The first equation written down refers to the virtual displacements of a shell (which is assumed to be a three-dimensional body), and the equilibrium equations referred to the nondeformed state are derived next. The static boundary conditions are then specified. Hooke's Law is written down in a generalized form. The authors then investigate the linear problem more thoroughly; the error permissible is of the order of deformation together with an error of the order of magnitude  $h^2/R^2$ . Here, R denotes the smaller radius of curvature of the surface, h being a constant. The computation course

Card 1/2

4

66409

On the Theory of Shells of Moderate Thickness

SOV/20-128-6-13/63

is followed up step by step. The equations derived here were applied to the solution of problems concerning the flexure of a circular plate with a radius  $a$ , and a rigid central disk with radius  $b$  under the action of a unilateral uniform pressure  $q$  in the region  $b \leq r \leq a$  and the force  $Q$  applied to the disk. Some results are summarized in a table. The investigation under review was completed by Teregulov under the supervision of Kh. M. Mushtari. There are 1 table and 6 references, 5 of which are Soviet.

TITLE: The effect of a longitudinal magnetic field on the operation of an  
He-Ne laser at  $\lambda = 0.6328 \mu$

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 2, 1966, 394-397

TOPIC TAGS: ~~longitudinal~~  
laser, gas laser, helium, neon, ~~tube~~, magnetic field, ~~discharge~~  
~~tube, photomultiplier~~

ABSTRACT: The effect of a longitudinal magnetic field on the operation of an  
He-Ne laser at  $\lambda = 0.6328 \mu$  was investigated experimentally. A discharge tube  
85 cm long and 4.4 mm in internal diameter, terminated with glass windows mounted  
at the Brewster angle, was filled to a pressure of 0.85 mm Hg with a neon-  
helium mixture at a ratio of 1:5.6. The discharge was excited at fixed current  
values. The magnetic field, which was parallel to the laser axis, could be varied  
from 0 to 2000 oe. A semi-confocal resonator was used with dielectric-coated  
mirrors ( $R \approx 99.2\%$ ) placed at 120 cm. The laser power was measured in relative  
units by means of an FEU-22 photomultiplier. Curves of the laser power  $P_1$  as a

Card 1/2

L 15798-66  
ACC NR: AP6007095

function of field intensity at various values of discharge current were plotted and analyzed. Three distinct regions could be observed: 1) a region in which a rapid initial increase in generation power occurred when the field intensity increased from 0 to 10—15 oe; 2) a region in which there was a subsequent, smoother increase in the signal, which may be preceded by a short sloping interval; and 3) (after a distinct power maximum at  $H \approx 150$  oe) a region in which a corresponding gradual decrease in laser output power occurred until the disruption of generation. The relative power increase in the first region was approximately equal for all values of discharge current and amounted to 150—200%. The rise in power in the second region was attributed to an increase in population inversion due to suppression by the magnetic field of generation at the  $3s_2 - 3p_1$  transition ( $\lambda = 3.39 \mu$ ). The smooth decrease in power in the third region was attributed to the separation of Doppler-broadened  $\sigma^+$ -components of radiation (both at  $1.15 \mu$  and  $3.39 \mu$ ) and to a decrease in the overlap region with an increase in  $H$ . The form of the function  $P_1 \approx P_1(H)$  changed when the parameters of the active medium varied sharply from the optimal. The longitudinal magnetic field  $H < 15$  oe re-established laser action at  $\lambda = 0.63 \mu$  when generation was disrupted because of an increase in the content of dopants in the discharge. Orig. art. [YK] has: 2 figures.

AUTHORS: Lukashenko, E.Ye., Zinov'yeva, N.K., Terekhin, V.P.  
and Feofanov, L.P.

TITLE: The mechanism of magnesiothermal reduction and forma-  
tion of titanium sponge in an industrial reactor

SOURCE: Akademiya nauk SSSR. Institut metallurgii. Titan i  
yego plavy. no. 6, 1961. Metallotermiya i elektro-  
khimiya titan, 14 - 20

TEXT: The authors carried out 6 experiments on the process using  
a reaction vessel enclosed in an industrial reactor and with  $TiCl_4$   
feed of 20, 30, 60, 80 and 95 % of that normally applied. The re-  
sults show that the mechanism of the process can be regarded as in  
three stages. In the first ( $TiCl_4$  consumption < 60 %) refined  
sponge and a thin lining form on the reactor wall.  $TiCl_4$  reduction  
prevails on the mirror surface of the fused Mg. The reaction rate  
is rapid and the role of secondary reactions unimportant. In the  
second stage ( $TiCl_4$  consumption < 80 %), Mg penetrates the pores

Card 1/2

The mechanism of magnesiothermal ...

S/598/61/000/006/002/034  
D245/D303

of the sponge, the lining becomes larger and the role of surface-diffusion processes and secondary chemical reactions becomes more marked. In the third stage ( $TiCl_4$  consumption  $\geq 80\%$ ), the volume of the reaction mass increases at the expense of the lining.  $TiCl_4$  reduction is gradual with intermediate formation of Ti sub-chlorides and their final reduction to metal. There are 3 figures and 8 references: 6 Soviet-bloc and 2 non-Soviet-bloc. The references to the English-language publications read as follows: F.S. Wartman and J. Oth, J. Electrochem. <i>Fundamental methods/Indirect methods/Geophysical methods</i>	
Priliminary edition; Soviet Union; pp. 10 (printed Geophysics); Collection of articles; No. 10) Moscow, Gosgeopress, 1958. 205 p. Series also inserted. 3,000 copies printed.	
Ed. A.I. Bogolyubov; Executive Ed.: N.P. Dobrynin; Tech. Ed.: K.A. Matkin.	
PURPOSE: The book is intended for engineers, technicians, geophysicists, and persons interested in the geophysical methods of petroleum prospecting.	
CONTENTS: The book is a collection of 15 articles dealing with the theoretical and practical problems of electrical sounding, seismic prospecting and gravimetry. Attention is given to electrical prospecting as not easily measurable technique and to the methods used to treat the data from this method in Soviet literature. New methods for the interpretation and detection of radioactive anomalies of drill holes as well as seismic and resistivity methods are analyzed. No personalities are mentioned without accompanying biographies or the articles.

Razvedochnaya i promyslovaya geofizika, vyp. 24 (Exploration and Industrial Geophysics, No. 24) Moscow, Gostoptekhizdat, 1958. 58 p. (Series: Obmen proizvodstvennym opyтом) 4,500 copies printed.

Ed.: M.K. Polshkov; Exec. Ed.: Ye. G. Pershina; Tech. Ed.: I.G. Fedotova.

PURPOSE: This booklet is intended for geophysicists as well as engineers and technicians engaged in geophysical work.

COVERAGE: This collection of articles discusses new methods of interpreting electrical logging, gravimetric and seismic data, and describes industrial geophysical instruments (cementometer, perforator, etc.). Improvements made on older apparatus (e.g., a change in the design of a perforator for radioactive electrical logging) are also discussed. References accompany each article.

prirodovedenija i tekhniki, Kr-25).

Ed.: A.Z. Bogdanov; Exec. Ed.: Ye.G. Pashkin; Tech. Ed.: A.S. Polozin.

PURPOSE: This booklet is intended for geophysicists as well as engineers  
and technical personnel in the petroleum industry.

CONTENTS: This collection of articles describes new equipment and instruments  
used in the petroleum industry. Individual articles discuss the single-  
valve electronic thermometer and the magnetic logging locator. Regional  
exploration problems such as electrical sounding at sea, electrical survey  
in paraffin areas etc. are also treated. References accompany each article.

## TABLE OF CONTENTS:

Datkovskii, A.A. Magnetic Logging Locator	16
Absil'rod, S.M. Single-Cable Electronic Thermometer	17
Absil'rod, S.M. Single-Cable Electronic Thermometer Card 1/2	18
Babitskii, I.I. An Example of the Relationship Between a Rock's Potential Resistivity and the Reservoir Properties	19
Aleksandrov, G.I., et al. Recording the Moment of Explosion in Deep Borehole Logging	21
Furman, Ye. I. Theoretical Curves of Marine Electrical Logging	22
Parashov, L.D. Simulation of Electrical Logging for Screening and Propagating Effects	24
Kal'cov, Ye.M. Use of Electrical Surveying Under Permafrost Conditions	25
Agranovich, N.A. Density of Rocks in Crustal	26
Sushina, N.P. Regarding Errors in Marine Geomagnetic Measurements Made From Surface Vessels	27
Averbukh, G.M. Possibility of Extending the Boundaries of a Poligone Magnetometer Scale by the Comparative Method	28
AVAILABLE: Library of Congress	29
